

HIGH PRESSURE LAMINATE FOR EXTERIORS

Exterior grade high pressure laminate is suitable for installation as a ventilated façade system. It provides breathing space for buildings, thus creating a vent for internal moisture to be released. It protects buildings from excess temperature in summer, excess cold in winter and provides noise insulation. The laminates can be perforated to achieve creative marvels.

The product is high in quality and has been exported to Europe for the last 10 years. It can be well compared in quality to the existing imported High Pressure Laminates.

Citadel works with international & local brands for the High Pressure Laminate projects.
